

## TOPFLIGHT INNOVATIONS

### *Prepress Capabilities*

Our on-site art department is a combination Macintosh® and Windows® network, complete with the latest software available to access every major graphic design application in the industry. Highly skilled staff artists utilize current digital technology and an exhaustive knowledge of production capabilities and idiosyncrasies to ensure your artwork is produced exactly as envisioned and proofed. We will always work with you to accomplish the best method of producing your design.

Some extra services we offer include entire prepress and proofing capabilities in-house with scanning, film output, various color proofs, and mockups, as well as file preparation for digital printing, consultations for design and product development, and complete concept designs. Innovative computerized trapping, proofing, and calibration ensure superior image detail, color reproduction, and proofs that match press output every time.

We also maintain a state-of-the-art, dust-free, air-controlled, platemaking laboratory. We produce all of our own plates and screens for flexographic, letterpress, and silkscreen printing, and feature digitally-imaged, thermally-processed printing plates. Digital plates are produced four times faster than conventional plates, and offer unmatched print quality, ink control, and production efficiency. This adds not only the highest degree of control and quality over the orders we produce, but allows unparalleled timeliness and responsiveness to changes in the course of a production run.

*The newest revolution in printing is digital plates, which provide faster production and better ink transfer for superior graphics and text quality.*

*An advanced video plate mounting system ensures print registration and consistency throughout a production run.*
