

TOPFLIGHT INNOVATIONS

Specialty Seals

Topflight has created a variety of thin film and paper seal solutions to protect against environmental contamination, product compromise, and consumer tampering.

Sifter seals provide a tabbed adhesive release which not only keeps powders locked inside the package, but also keeps them from contaminating the enclosed puff or sponge applicator. Clear disc dust covers offer the same protection in a custom-fitted, die-cut part. Both can be produced in an unlimited array of shapes, colors, and materials. Additionally, we offer an original, multi-layer design with a built-in tab that removes more cleanly and easily, and protects powders more efficiently.

While sifter seals and dust covers seal and protect dry ingredients, grid seals maintain the moisture in products. Originally designed to deter dehydration of certain gel products, grid seals act to seal in moisture, freshness, and aroma, while keeping exterior elements from contaminating or compromising the ingredients.

Whether printed with graphics and text or unprinted, all Topflight seals are customized for each individual application's specifications. They utilize permanent adhesives and substrates which strongly adhere to various substrates, but peel away cleanly, leaving no residue. And all offer a secure, reliable barrier of protection for your product.

Several sealing options are available for a variety of applications to ensure product reliability and protection.

Topflight partnered with several leading companies to develop the material and adhesive combinations necessary to guarantee grid seal performance.
