

TOPFLIGHT INNOVATIONS

Ultrathin Film Labels

Along with a number of printing and converting advancements, Topflight has also helped to pioneer many innovations in material construction, including the thinnest gauge label film in the industry. The durable, abrasion resistant, pressure sensitive, polyester film was designed specifically for PC cards and other similar components. At only 0.001", it is the most versatile, flexible, and economical option to other card identification methods.

Topflight ultrathin labels are available in an unlimited assortment of die-cut shapes and sizes, providing a precise fit or wrap for your application. Labels can be produced in any color, with differing front and back versions, or with imprintable areas for variable information or identification.

Despite their slim construction, these labels withstand the rigorous performance requirements of internal computer components, provide total protection of printed copy from abrasion, and dispense accurately and reliably with automatic labeling systems. Topflight ultrathin labels allow designers to include more logic circuitry or provide a smaller overall product.

Specially designed topflight labels are perfect for PC cards which provide increased memory modems, or networking and faxing capabilities.

Topflight's 1 mil film offers completely protected printing ideal for any application with tight space and performance constraints.
